1 Data cleaning rule

According to GSCF_Data_Linking_2015.pdf, I cleaned the raw data sets and kept only linked children for all waves only. Here is my cleaning rules.

First of all, I did not clean any data sets for 2000 wave, since the linking file and the GSCF_merge_pid.dta are created to make sure 2004, 2007, 2009, and 2015 have the samekids or same households as wave 2000.

Take wave 2004 as an example:

- t - target kids data.

Firstly open the GSCF_merge_pid.dta. I kept pid00==1 to make sure the data only include target kids. I kept samekid00(wave code, i.e., samekid0004 for wave2004)==1 to make sure the data only includes the samekid across waves. Now the data will only include target child, who appears in both wave 2000 and wave 2004. Then I merge this dataset with all 't' target children files.
I think there is no need to keep pid04 in the raw data set to merge with the linkng file, if you can make sure the kid is the samekid in each hhid. (i.e, I only merge 1:1 hhid using GSCF_merge_pid.dta; but did not merge 1:1 hhid pid04 using GSCF_merge_pid.dta.)

- ts - target kids and siblings data.

Firstly open the GSCF_merge_pid.dta. For datasets with 'ts', we can only keep samekid variable. I keep samekid0004==1 to make sure the data only includes samekid. There is no need to keep pid00==1 or pid00==4, since 'ts' data set include all sibling and kids. There is no need to keep pid00!=, since if you keep samekid0004==1, all pid00==. will be dropped at the same time. Then I merge this dataset with all 'ts' target children files.

- s - siblings data

Firstly open the GSCF_merge_pid.dta. The pid code for sibling data in wave 2000 could be 4 or other number. Thus I first keep if pid00!=1 pid00!=., and then keep if samekid0004==1. Then I merge this dataset with all 's' target children files.

I do not use pid04 to merge because there might be error in pid04 of 's' datasets. As long as the kid is in 2000, which cleaned through (keep if pid00!=1 pid00!=.) and is the samekid between 2000 and wave 2004, it should be right.

- n - I did not clean them

The number of observation for each data is listed in the excel file.
